# Opportunities for data in the asset life

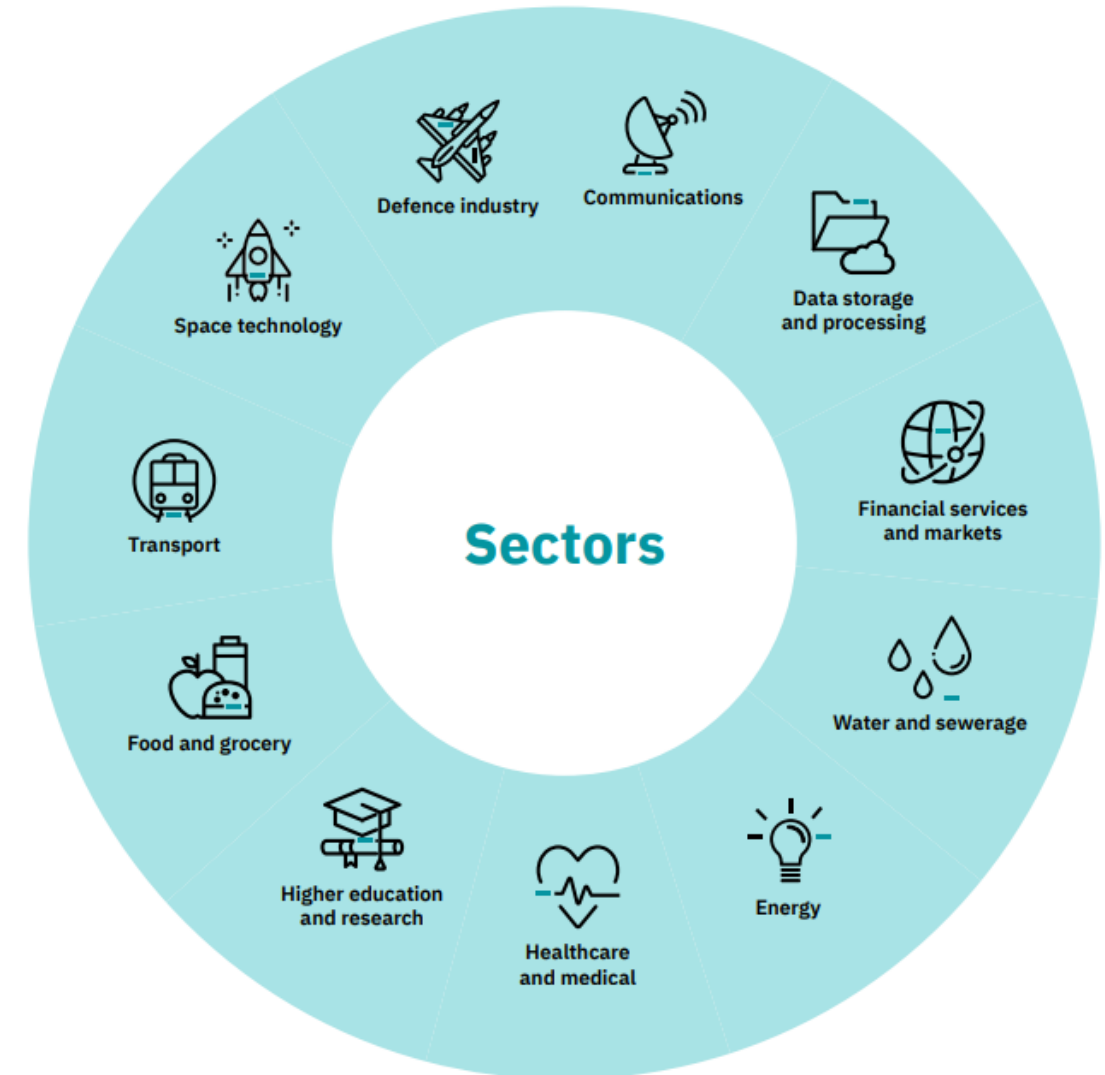

# Legislation

In Australia, the

*Security of Critical Infrastructure Act 2018 (SOCI)* now requires private asset owners that are defined as critical infrastructure to minimise or eliminate a material risk, and mitigate the impact, of natural hazards on the critical infrastructure.

*Mandatory climate-related financial disclosures*, providing Australians and investors with greater transparency and more comparable information about an entity exposure to climate-related financial risks and opportunities and climate-related plans and strategies. (Mandatory climate-related financial disclosures - Policy position statement)

**SOCI Act sectors and asset classes**

# Urban Heat Island (UHI) Effect

## Contributing factors

### Building geometry

- ✓ Height to area ratio of buildings
- ✓ Building density
- ✓ Sky view factor

### Building fabric

- ✓ Albedo distribution
- ✓ Impervious surface area
- ✓ Thermal mass

### Anthropogenic heat

- ✓ From buildings
- ✓ From people
- ✓ From transport

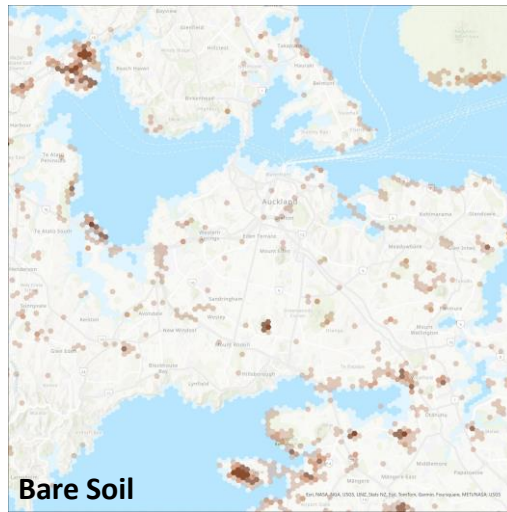

### Surface Cover

- ✓ Tree cover
- ✓ Percentage Green space
- ✓ Impervious surface area

# Land cover classification – urban area

# Automated asset inspections powered by machine learning

# Brief overview of Loupe 360

General architecture in Loupe 360

Automated  
Inspection

Automatic Defect  
Detection

Immersive  
Visualisation

## Survey, Specification and Build:

UAV (Drones), UGV (e.g. robot dog)  
Mobile: maintenance vehicle  
integrated / bespoke loco mounted  
Fixed: Integrated onto fixed  
infrastructure e.g. maintenance rails

## AI and Machine Learning

Defects detection (e.g. water &  
tree root ingress, spalling,  
cracking) and obstruction  
Change detection (e.g. temporal  
progression and defect growth)  
Inventorying: (e.g. FLS signage,  
MEP equipment cataloguing)

## User Interface

Collaborative decision-making cloud  
platform  
Intuitive virtual walk throughs and  
ML indicators  
User defined analytics, risk scoring  
and automated reporting

# Use cases

## Asset defect detection

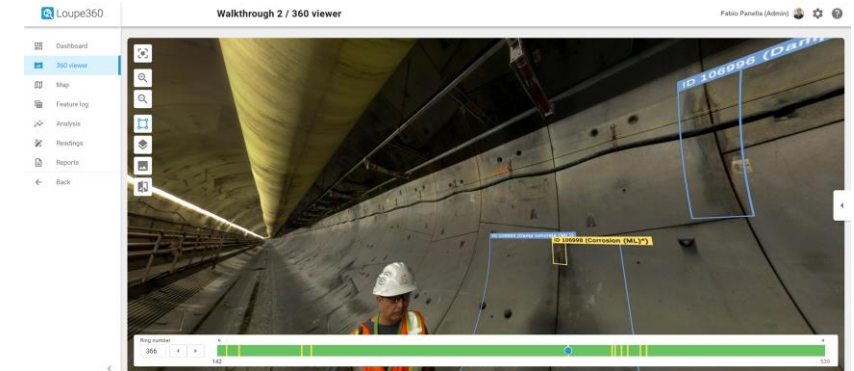

- Impartial assessment of asset condition.
- The initial inspection serves as the baseline for future change detection analysis.

## Asset management prioritisation

- Change detection.
- Strategic inspection and maintenance planning.
- Data driven expenditure optimisation.

## Asset protection

- Identifying different types of defects and inferring their root causes allows preventative, protective works to happen beyond the asset itself.

# Automated inspection

Machine Learning (ML) powered tool for asset management

Automated  
Inspection

Automatic  
Defect Detection

Immersive  
Visualisation

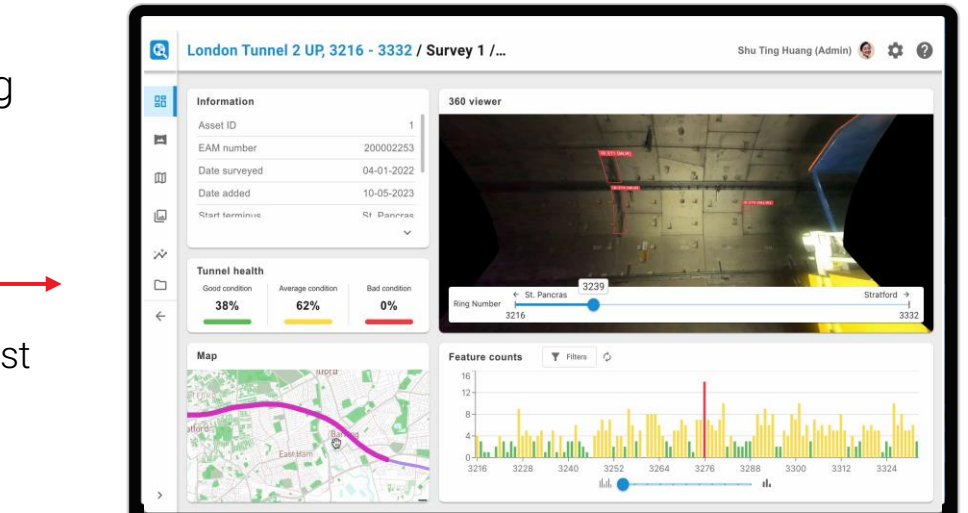

Hi-res 360-degree camera data capturing  
ML-powered predictive analytics for  
repeatable & objective outcomes

>70% reduction of time  
>50% reduction site staff

Up to 40% O&M cost  
saving

# Machine Learning-powered condition assessment

Automated  
Inspection

Automatic  
Defect Detection

Immersive  
Visualisation

# Intuitive dashboarding for asset management

Automated  
Inspection

Automatic  
Defect Detection

Immersive  
Visualisation

The data is visualised in a web-based dashboard. Easy to interpret visuals accurately describe the asset conditions.

Automated reporting is also available to match the client's standards.

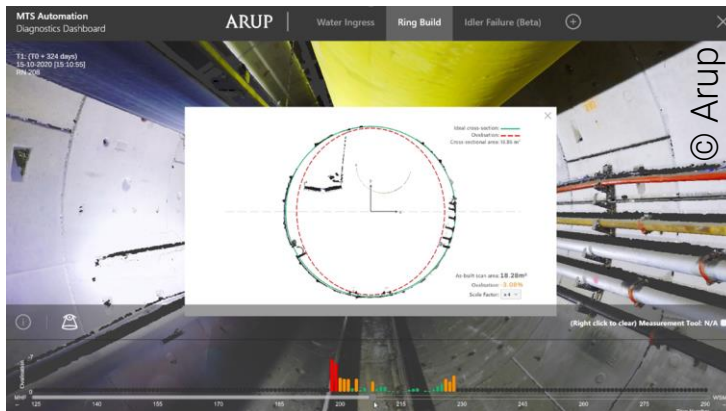

# Beyond defect detection

Detection of defects beyond the visual spectrum from thermal imagery (e.g., early signs of dampness in concrete, equipment overheating, cable health assessment).

AI-powered automated inventorying

Geometric conformity of cross sections considering relevant standards and tolerances

Detection of obstructions from revenue vehicles built-in dash cameras. It can be deployed for operation and maintenance of rail infrastructure (e.g., vegetation maintenance)

ARUP
